What are microgrids & how do they work?

Microgrids are local power grids that can be operated independently of the main - and generally much bigger - electricity grid in an area. Microgrids can be used to power a single building, like a hospital or police station, or a collection of buildings, like an industrial park, university campus, military base or neighbourhood.

What happens if a microgrid is grid-connected?

If the microgrid is grid-connected (i.e., connected to the main electric grid), then the community can draw power from the main electric grid to supplement its own generation as needed or sell power back to the main electric grid when it is generating excess power.

What can a microgrid power?

A microgrid can also power just a key portion of its area, such as emergency services and government facilities. For most of its history, the electric grid has relied mainly on large, central power stations, using resources like coal, hydropower and nuclear power.

How many microgrids are there?

In the US, there are 160 microgrids, according to the Center for Climate and Energy Solutions. Alaska, Texas, New York and California are some of the seven states where these are mostly based. India also has 160 microgrid solutions across four states, according to Hive Power, a Swiss smart grid specialist. More than 80% of these are solar powered.

Are microgrids self-contained?

But because microgrids are self-contained, they may operate in "island mode," meaning they function autonomously and deliver power on their own. They usually are comprised of several types of distributed energy resources (DERs), such as solar panels, wind turbines, fuel cells and energy storage systems.

Can microgrids be built at a small scale?

These can easily be built at a very small scale, down to a few solar panels on a rooftop. And because large tracts of land are needed to make solar and wind farms that produce as much energy as central power plants, it is often more practical to build them as smaller, "distributed" resources. This, in turn, makes it easier to build microgrids.
